Several retinoids have shown promising activity as antitumor and cancer chemopreventive agents by inhibiting carcinogenesis at the initiation, promotion, and progression stages. 88 The anticancer activity of the retinoids is mainly due to their binding to nuclear receptors that act as hormone receptors activating target genes. They are classified as classical retinoic acid receptors (RARs) and nonclassical retinoid X receptors (RXRs), each of which has three isoforms (α , β , and γ).
