Gas turbine aero-engines are a key aspect of the modern global aerospace sector. The developments in gas turbine technology have played a vital role in the substantial improvements which have been achieved over several decades.

Aerospace plays a vital role in both the global and national economy, and it is envisaged that the gas turbine will continue to be at the heart of future propulsion system developments.

The basic operation of the gas turbine is a Brayton cycle with air as the working fluid : atmospheric air flows through the compressor that brings it to higher pressure ; energy is then added by spraying fuel into the air and igniting it so that the combustion generates a high-temperature flow ; this high-temperature pressurized gas enters a turbine, producing a shaft work output in the process, used to drive the compressor ; the unused energy comes
