Reactive Attachment Disorder | Psychology Today

Reactive attachment disorder (RAD) is described in clinical literature as a severe and relatively uncommon disorder that can affect children. RAD is characterized by markedly disturbed and developmentally inappropriate ways of relating socially in most contexts. It can take the form of a persistent failure to initiate or respond to most social interactions in a developmentally appropriate way—known as the "inhibited form".

Reactive attachment disorder - Wikipedia

Reactive attachment disorder (RAD) treatment is both necessary and possible. RAD is a trauma disorder that results from severe neglect in infancy. Because of extreme neglect, an infant doesn't form an attachment to a caregiver; consequently, he/she doesn't develop a sense of protection, safety, and trust in the world.

Reactive Attachment Disorder (RAD) Treatment | HealthyPlace

Reactive Attachment Disorder (RAD) is a complex psychiatric illness that can affect young children. It is characterized by serious problems in emotional attachments to others. RAD usually presents by age 5, but a parent, caregiver or physician may notice that a child has problems with emotional attachment by their first birthday.
