### Self Healing Application In Engineering

3.1 Incorporation of self-healing features within a secondary bondline As discussed previously in the 3M meeting in Brussels, the healing capability of self-healing fibre reinforced polymer (FRP) composites has to be adapted to a certain type of damage event.

### Self-Healing - Application in Engineering

Rapid self-healing hydrogels based on chemically crosslinked polymeric systems have been demonstrated (Phadke et al., 2012) for various smart self-healing applications. A flexible side-chain molecule that contains just the right size and number of water-soluble and water-repelling chemical groups to stretch across an interface and bond with the side chains of the nearby hydrogel has been engineered.

Rarely, an entire service or region may experience a disruption, but even those must be planned for. Therefore, design an application to be self healing when failures occur. This requires a three-pronged approach: Detect failures. Respond to failures gracefully. Log and monitor failures, to give operational insight.
