factoring, we must always have the equation in the form " $(\text{quadratic expression}) = (\text{zero})$ " before we make any attempt to solve the quadratic equation by factoring. Returning to the exercise: The Zero Factor Principle tells me that at least one of the factors must be equal to zero.

Solving Quadratic

Equations by Factoring.

From the example

above, the quadratic

problem simply reduces

to a linear problem

which can be solved by

simple factorization.

File Type PDF

Solving

Example 1: Given $x^2 +$

$$5x + 6 = 0 \quad \left(x + 3\right) \left(x + 2\right) = 0$$

(factoring the polynomial) $\left(x + 3\right) = 0$ OR $\left(x + 2\right) = 0$. Thus $x = -3$,

Or $x = -2$. The example above shows that it is indeed easy to solve

quadratics by factoring method. However, the method only works for the most basic

To solve this, you would use the zero product property. If you make one of the parentheses equal to zero then the

File Type PDF

Solving

whole left side is equal to zero (because zero multiplied by anything is zero). So you'd set the first set of parentheses like so: $(x-2)=0$. Then to isolate "x", you would add 2 to both sides to get $x=2$.
