The TCP/IP protocol suite consists of many protocols that operate at one of 4 layers. The protocol suite is named after two of the most common protocols - TCP (transmission Control Protocol) and IP (internet Protocol).

TCP/IP was designed to be independent of networking Hardware and should run across any connection media.

The TCP/IP Model and Protocol Suite Explained for Beginners

We sometimes hear people call it "the TCP/IP protocol suite," which means that they're talking about layers 1-4 plus 7, similar to how we presented layers. TCP lives at layer 4, along with its unreliable friend UDP. TCP stands for Transmission Control Protocol, by the way. Remember the header picture from the IP article? When a packet is encapsulated,

we'll of course have the IP header at layer 3, and immediately following is the TCP header, which becomes the "data" for the IP header.

An IP address is a 32-bit number that uniquely identifies a host (computer or other device, such as a printer or router) on a TCP/IP network. IP addresses are normally expressed in dotted-decimal format, with four numbers separated by periods, such as 192.168.123.132.

Terminology note: TCP and IP are used together so often that they are commonly referred to as the "TCP/IP protocol suite" or just "TCP/IP". A software implementation of TCP/IP is usually called a "stack" -- meaning that, for example, your computer's operating system almost certainly includes a TCP/IP stack.
